

ABSTRACT OF THE DISCLOSURE

A cowl assembly has a base and a twist ring mounted to the base. The twist ring defines an axis. The twist ring is rotatable relative to the base about the axis, between a primary orientation and a secondary orientation. A cover is removably attached to the base. A cowl is coupled to the cover. The cowl
5 engages the twist ring. The cowl is pivotable with the twist ring between the primary and secondary orientations. The twist ring blocks the cowl from pivoting beyond the primary and secondary orientations to an overtravel orientation, in which the cowl is freely removable from the cover.
